

# 2D Homographies

*Raul Queiroz Feitosa*

# Objective

To introduce the problem of **estimating 2D projective transformations** as well as some **basic tools for parameter estimation**.

# Outline

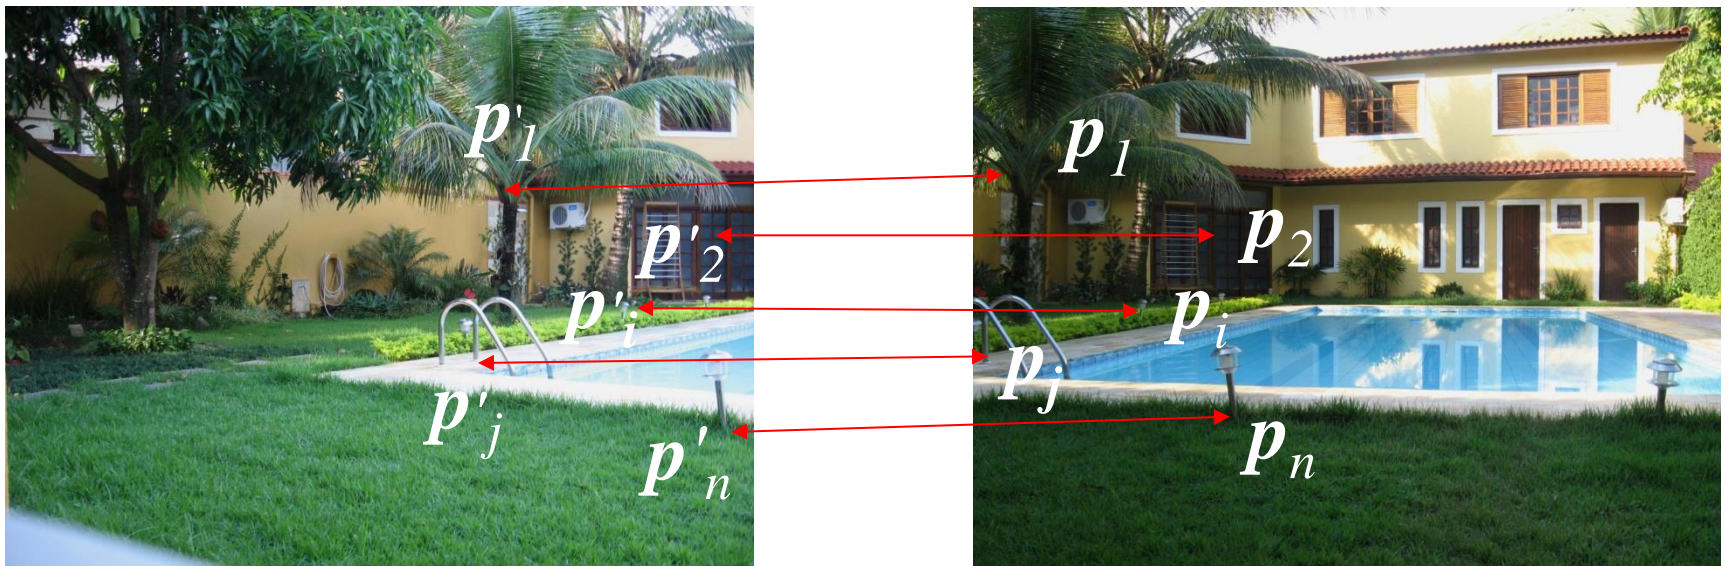

- Motivation
- Direct Linear Transformation (DLT)
- Normalization
- Robust Estimation
- Non Linear Method
- Assignment

# Motivation: Panoramas

# Building a Panorama

- **Step 1:** find pairs of corresponding points

# Building a Panorama

- **Step 2:** Estimate the matrix  $\mathcal{H}$  (the homography) such that

$$\mathbf{p}_i = \mathcal{H} \mathbf{p}'_i$$

where  $\mathbf{p}_i$  and  $\mathbf{p}'_i$  are **homogeneous** vectors representing corresponding points, i.e.

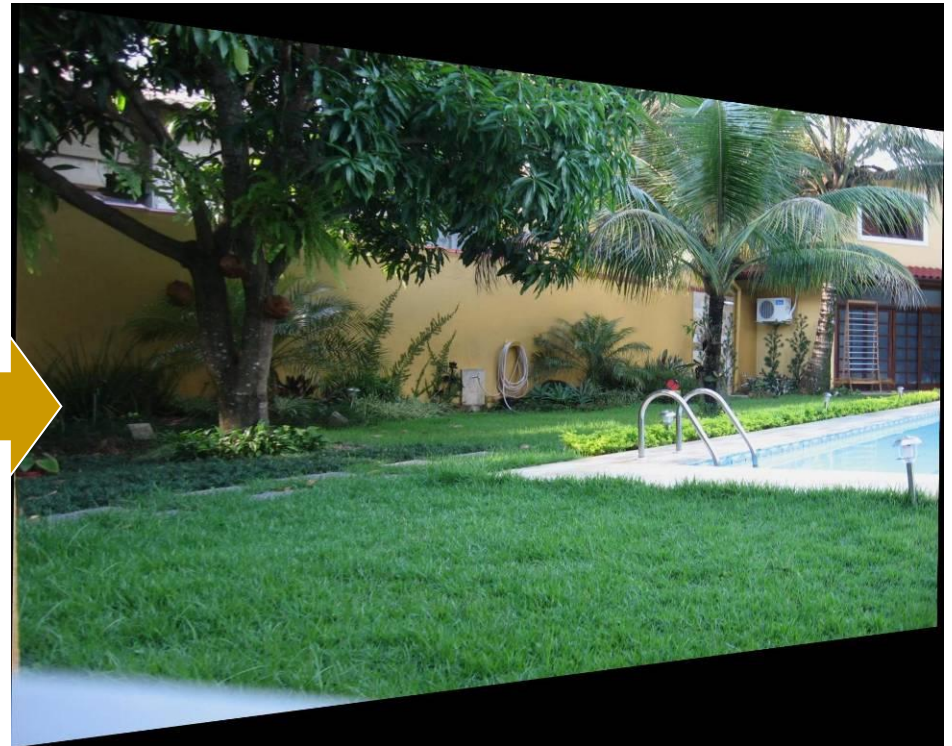

$$k \begin{pmatrix} u_i & v_i & 1 \end{pmatrix}^T = \mathcal{H} \begin{pmatrix} u'_i & v'_i & 1 \end{pmatrix}^T$$

for some  $k \neq 0$  (homogeneous) and for all  $1 \leq i \leq n$ .

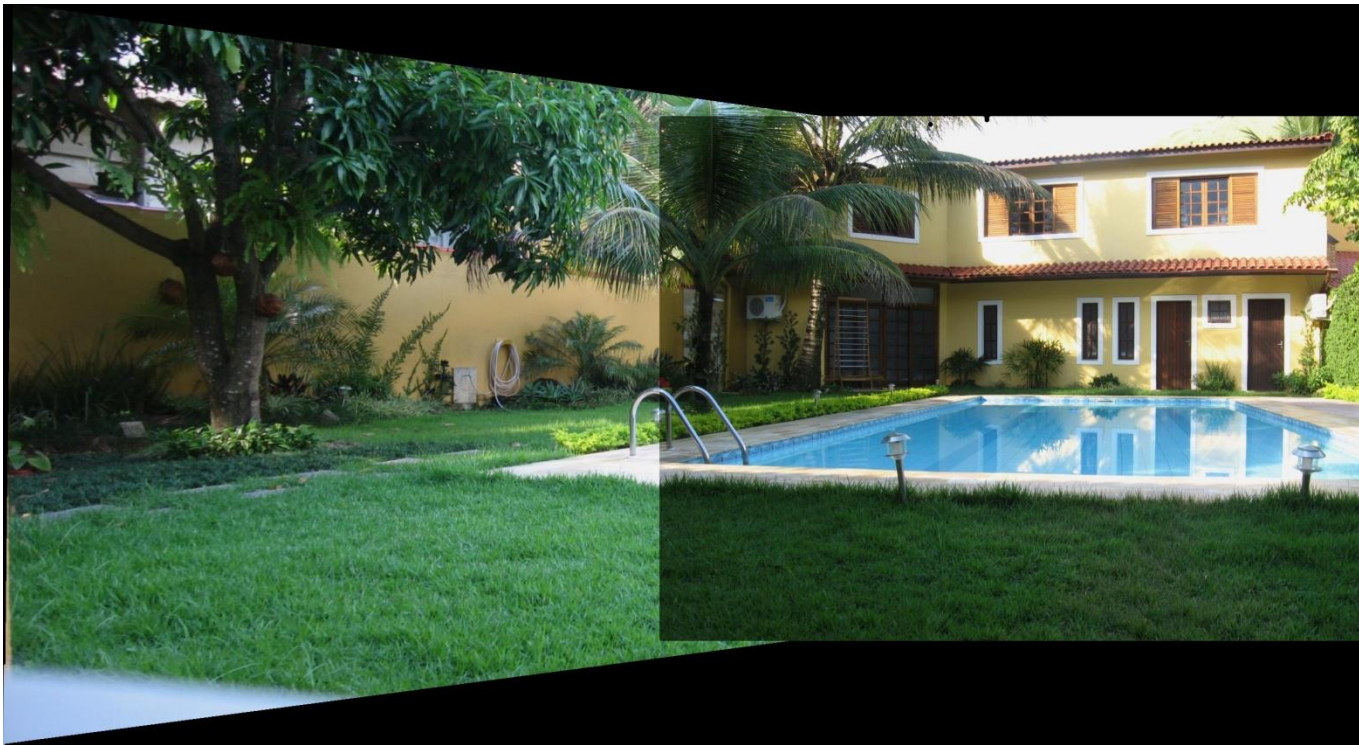

# Building a Panorama

- **Step 3:** transform geometrically one image by using the matrix  $\mathcal{H}$

# Building a Panorama

- **Step 4:** align and blend (not here) the images

# Outline

- Motivation

- Assignment

# Direct Linear Transformation

## Derivation:

Let  $\mathbf{h}_j^T$  be the  $j$ -th row of  $\mathcal{H}$ , so we may write

$$\mathcal{H} = \begin{bmatrix} h_1 & h_2 & h_3 \\ h_4 & h_5 & h_6 \\ h_7 & h_8 & h_9 \end{bmatrix} \begin{array}{l} \mapsto \mathbf{h}_1^T \\ \mapsto \mathbf{h}_2^T \\ \mapsto \mathbf{h}_3^T \end{array} \quad \Rightarrow \quad \mathcal{H} \mathbf{p}'_i = \begin{pmatrix} \mathbf{h}_1^T \mathbf{p}'_i \\ \mathbf{h}_2^T \mathbf{p}'_i \\ \mathbf{h}_3^T \mathbf{p}'_i \end{pmatrix}$$

Clearly  $\mathbf{p}_i \times \mathcal{H} \mathbf{p}'_i = \mathbf{0}$ . Thus

$$\mathbf{p}_i \times \mathcal{H} \mathbf{p}'_i = \begin{pmatrix} v_i \mathbf{h}_3^T \mathbf{p}'_i - \mathbf{h}_2^T \mathbf{p}'_i \\ \mathbf{h}_1^T \mathbf{p}'_i - u_i \mathbf{h}_3^T \mathbf{p}'_i \\ u_i \mathbf{h}_2^T \mathbf{p}'_i - v_i \mathbf{h}_1^T \mathbf{p}'_i \end{pmatrix} = \mathbf{0}$$

# Direct Linear Transformation

## Derivation (cont.):

After some manipulation, you obtain

$$3 \left\{ \overbrace{\begin{bmatrix} \mathbf{0}^T & -\mathbf{p}_i'^T & v_i \mathbf{p}_i'^T \\ \mathbf{p}_i'^T & \mathbf{0}^T & -u_i \mathbf{p}_i'^T \\ -v_i \mathbf{p}_i'^T & u_i \mathbf{p}_i'^T & \mathbf{0}^T \end{bmatrix}}^9 \begin{pmatrix} \mathbf{h}_1 \\ \mathbf{h}_2 \\ \mathbf{h}_3 \end{pmatrix} \right\} = \mathbf{0}$$

only 2 are  
linearly  
independent

where  $\mathbf{h} = \begin{pmatrix} \mathbf{h}_1 \\ \mathbf{h}_2 \\ \mathbf{h}_3 \end{pmatrix}, \quad \mathcal{H} = \begin{bmatrix} h_1 & h_2 & h_3 \\ h_4 & h_5 & h_6 \\ h_7 & h_8 & h_9 \end{bmatrix}$

# Direct Linear Transformation

## Derivation (cont.):

Each pair of points generates two equations of the form

$$\mathcal{A}_i = \begin{bmatrix} \mathbf{0}^T & -\mathbf{p}_i'^T & v_i \mathbf{p}_i'^T \\ \mathbf{p}_i'^T & \mathbf{0}^T & -u_i \mathbf{p}_i'^T \end{bmatrix} \begin{pmatrix} \mathbf{h}_1 \\ \mathbf{h}_2 \\ \mathbf{h}_3 \end{pmatrix} = \mathbf{0}$$

With  $n$  pairs we get  $2n$  equations on 9 unknowns!

an homogeneous  
linear equation  
system

$$\begin{bmatrix} \mathcal{A}_1 \\ \vdots \\ \mathcal{A}_n \end{bmatrix} \begin{pmatrix} \mathbf{h}_1 \\ \mathbf{h}_2 \\ \mathbf{h}_3 \end{pmatrix} = \mathbf{0} \Rightarrow 4 \text{ pairs of points are enough!}$$

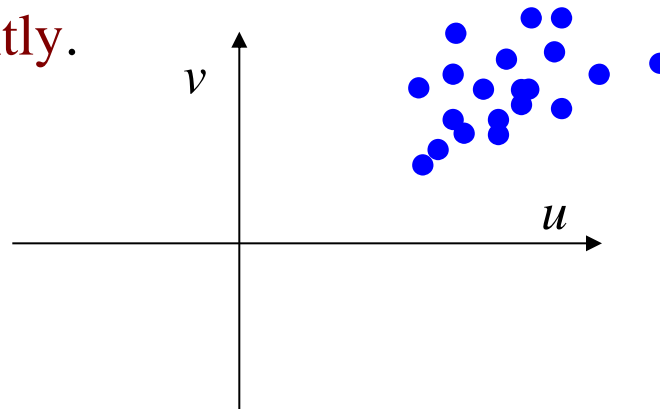

# Outline

- Motivation
- The Direct Linear Transformation (DLT)
- Normalization
- Robust Estimation
- Optimal Estimation
- Assignment

# Normalization

For improved estimation it is **essential**<sup>†</sup> for DLT to **normalize the data sample**, as follows

1. The points are translated so that their **centroid** is **at the origin**
2. The points are scaled so that the **average distance** from the origin is equal to  $\sqrt{2}$  .
3. This transformation is **applied to** each of the **two images independently**.

<sup>†</sup>Multiple View Geometry in computer vision, 2nd Ed., R. Hartley and A. Zisserman, 2003, Cambridge, section 4.4.4, pp.107.

# Normalization

Normalization is carried out by multiplying the data vector by proper matrices  $\mathbf{T}$  and  $\mathbf{T}'$

$$\tilde{\mathbf{p}}_i = \mathbf{T} \mathbf{p}_i \quad \text{and} \quad \tilde{\mathbf{p}}'_i = \mathbf{T}' \mathbf{p}'_i$$

DLT is applied to  $\tilde{\mathbf{p}}_i$  and  $\tilde{\mathbf{p}}'_i$  to obtain  $\tilde{\mathcal{H}}$ , which is actually different from  $\mathcal{H}$ .

$$\mathbf{T} \mathbf{p}_i = \tilde{\mathcal{H}} \mathbf{T}' \mathbf{p}'_i \rightarrow \mathbf{p}_i = \underbrace{\mathbf{T}^{-1} \tilde{\mathcal{H}} \mathbf{T}'}_{\mathcal{H}} \mathbf{p}'_i$$

# Normalization

The normalizing matrix  $\mathbf{T}$  is given by

$$\mathbf{T} = s \begin{pmatrix} 1 & 0 & -\bar{u} \\ 0 & 1 & -\bar{v} \\ 0 & 0 & 1/s \end{pmatrix}$$

where  $\bar{u}, \bar{v}$  are the mean values of  $u_i, v_i$  respectively

and 
$$s = \sqrt{2n} / \sum_{i=1}^n \left[ (u_i - \bar{u})^2 + (v_i - \bar{v})^2 \right]^{1/2}$$

The computation of  $\mathbf{T}'$  is analogous.

# Normalization

## ■ Step-by-step

- Compute the normalization matrices  $\mathbf{T}$  and  $\mathbf{T}'$
- Perform normalization by computing

$$\tilde{\mathbf{p}}_i = \mathbf{T} \mathbf{p}_i \quad \text{and} \quad \tilde{\mathbf{p}}'_i = \mathbf{T}' \mathbf{p}'_i$$

- Apply DLT to  $\tilde{\mathbf{p}}_i$  and  $\tilde{\mathbf{p}}'_i$  and compute  $\tilde{\mathcal{H}}$
- Denormalize the result by computing

$$\mathcal{H} = \mathbf{T}^{-1} \tilde{\mathcal{H}} \mathbf{T}'$$

- Assignment

# Robust Estimation

## RANSAC robust estimation

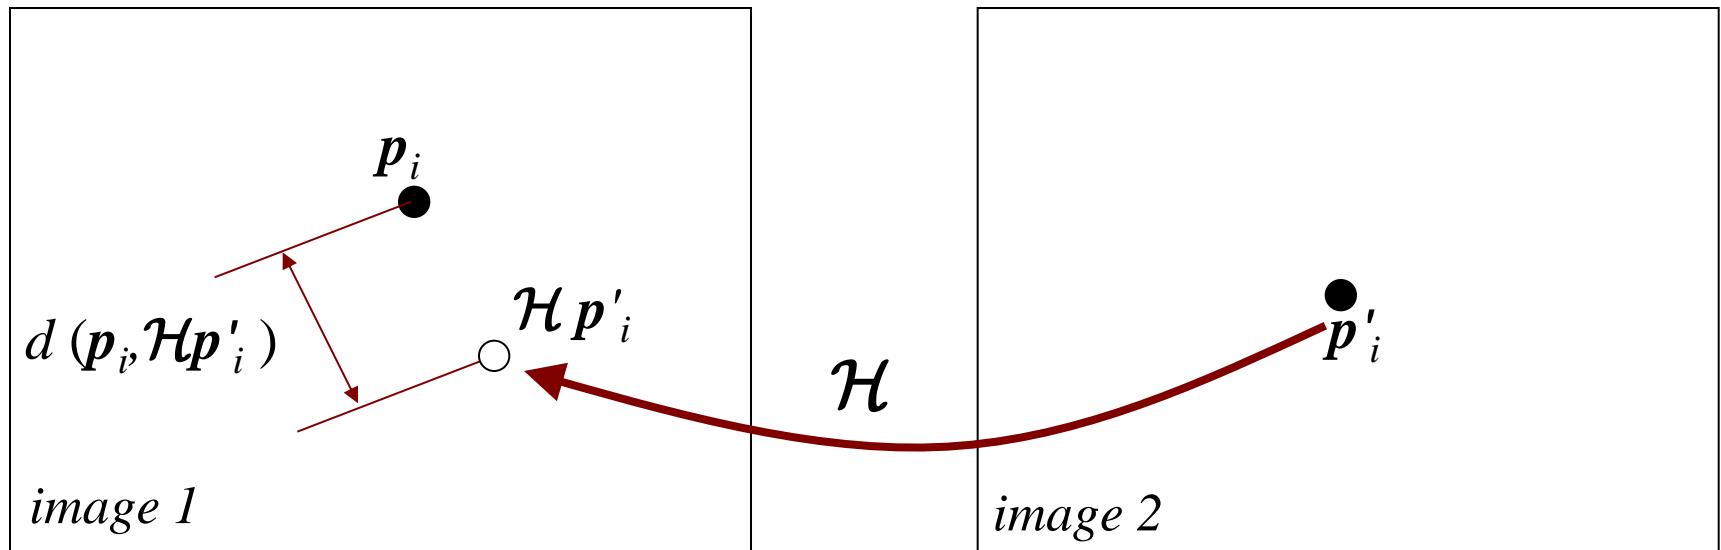

1. Repeat for  $k$  iterations
  - a) Select a random sample of 4 pairs of corresponding points and compute  $\mathcal{H}$ .
  - b) Calculate for each putative correspondence the “distance”,
$$d(p_i, \mathcal{H}p'_i) = \|p_i - \mathcal{H}p'_i\|$$
from the projected to the actual point position.
  - c) Determine the number of inliers consistent with  $\mathcal{H}$  i.e.,
$$d(p_i, \mathcal{H}p'_i) < t \text{ pixels.}$$
2. Choose the  $\mathcal{H}$  with the largest number of inliers.
3. Recompute  $\mathcal{H}$  with the inliers.

# Robust Estimation

## The geometric distance

It is the distance between the projected and the actual position of the corresponding points

$$d(p_i, \mathcal{H}p'_i) = \|p_i - \mathcal{H}p'_i\|$$

# Outline

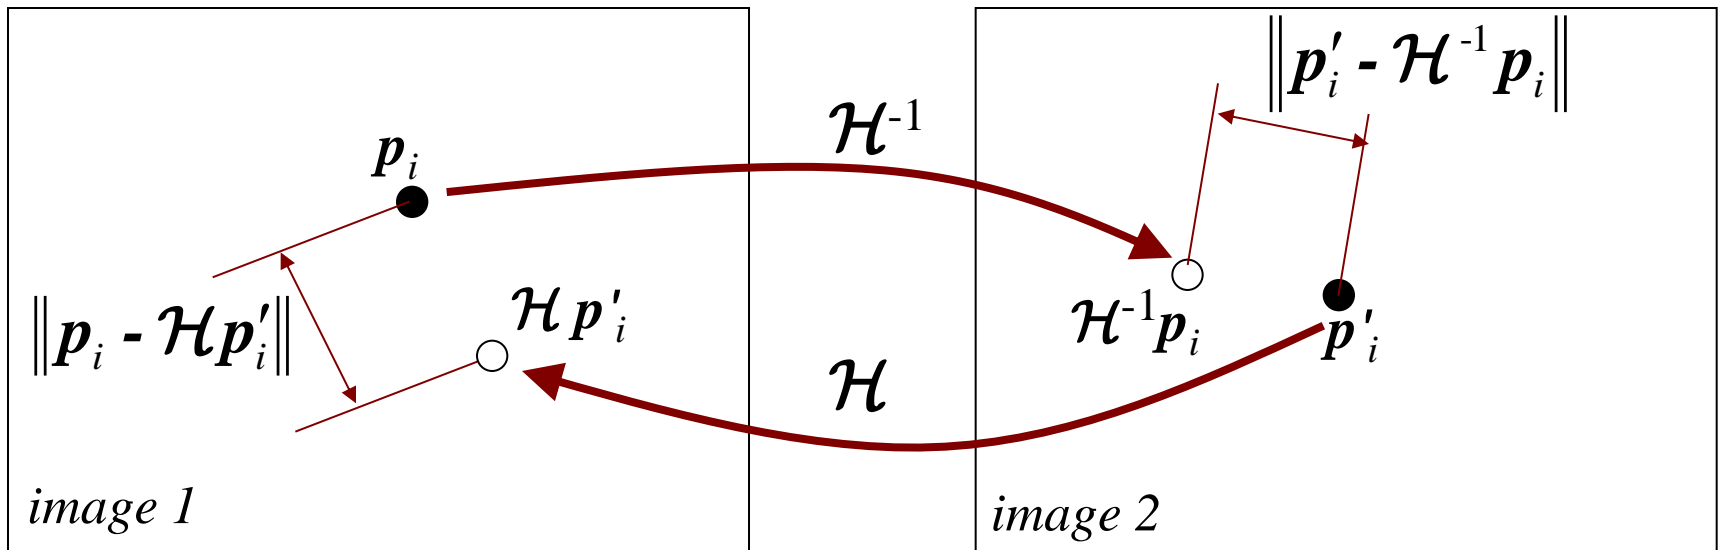

- Motivation
- The Direct Linear Transformation (DLT)
- Normalization
- Robust Estimation
- Non Linear Method
- Assignment

# Non Linear Method

## ■ Reprojection error

Sum of the squared **errors** of the **forward** and the **backward** transformation, i.e.,

$$D_i = \|p_i - \mathcal{H}p'_i\|^2 + \|p'_i - \mathcal{H}^{-1}p_i\|^2$$

# Non Linear Method

## ■ Computing $\mathcal{H}$ from the reprojection error

By finding a solution that minimizes the sum of reprojection errors of all  $n$  correspondences, i.e., if

$$D_i = \|p_i - \mathcal{H}p'_i\|^2 + \|p'_i - \mathcal{H}^{-1}p_i\|^2$$

the homography is obtained by solving the non linear equation system below

$$\mathbf{D} = \begin{bmatrix} D_1 \\ D_2 \\ \vdots \\ D_n \end{bmatrix} = \mathbf{0}$$

# Panorama Example

## ■ Input Images

## ■ Panorama

# Outline

- Motivation
- The Direct Linear Transformation (DLT)
- Normalization
- Robust Estimation
- Non Linear Method
- Assignment

# Assignment

## General Formulation

- i. Take a set of images of the same scene, rotating the camera around its optical center.
- ii. For a pair of images collect manually a set of corresponding points (*hint*: use the function *captura\_pontos*).
- iii. Compute the homography  $\mathcal{H}$  from these correspondences.
- iv. Create a panorama from both images and from  $\mathcal{H}$ . (*hint*: use the function *Panorama2*).
- v. Add new images by repeating steps *i* to *iv*.

# Assignment

## Assignment 1

1. Write a MATLAB program that implements the solution for the problem formulated in the previous slide
  - i. By using DLT without normalization
  - ii. By using DLT with normalization (*hint*: use the function *NormalizaPontos*)

Compare the results obtained by each approach.

# Assignment

## Assignment 1 (cont.)

1. Your main task here is the development of a function that implements DLT, which may have the following help

```
% H=DLT(u2Trans,v2Trans,uBase,vBase,)  
% Computes the homography H applying the Direct Linear Transformation  
% The transformation is such that  
%      p      = H      p'  
% (uBase vBase 1)'=H*(u2Trans v2Trans 1)'  
%  
% INPUTS:  
% u2Trans, v2Trans - vectors with coordinates u and v of the image to be transformed (p')  
% uBase, vBase     - vectors with coordinates u and v of the base image p  
%  
% OUTPUT  
% H - 3x3 matrix with the Homography  
%  
% your name - date
```

# Assignment

## Assignment 2

2. Provide a new solution for the same general problem where DLT is replaced by the non linear method.

Some hints:

- use the MATLAB function *lsqnonlin*.
- the result of  $\mathcal{H} \mathbf{p}'_i$  is in homogeneous coordinates, i.e., it must be scaled to make the third vector component equal 1, and to obtain the actual column-row coordinates.

# Assignment

## Assignment 3

3. Provide a new solution for the same general problem where DLT/ the non linear method is replaced by RANSAC.

Some hints:

- ❑ use DLT to obtain a initial solution
- ❑ Use the reprojection error in RANSAC step 3 (you have it from previous assignment)
